

# No-U-Steer®

“Look, ma – no hands!” Newly certified transit operator Matilda Dinklaker shows off her motoring prowess as she takes Bingtown’s new semi-automatic bus for a test drive. Unlike a fully autonomous vehicle, which requires no human input to navigate roads, the Bingtown Bus, utilizing patented **No-U-Steer®** software, works hand in hand with a non-artificial intelligent life form. A transit operator positioned at the rear of the vehicle alertly watches traffic conditions and executes simple hand gestures that signify “slow,” “fast,” “left,” “right,” or “none of the above.” A camera in the bus’s ceiling instantly feeds the images to data processors in the steering wheel and accelerator and brake pedal. The result is a smooth public transit ride (usually) without needing to rely on a sometimes unreliable driver. *No-U-Steer: Tomorrow’s Technology Today!*
